

git

R&D Meeting

29-Oct-2013

What is **git**?

- See <http://git-scm.com/>
- git is a very fast, elegantly implemented, version control system with a tiny footprint

Why you should care

- We (should) collaborate by sharing computer files
 - documents, data files, macros, i.e. files of any type that can be edited/changed by a team of people
- Somebody could (and perhaps should) be responsible for *maintaining* a current version

Short video about **git**

- <http://git-scm.com/documentation>

How we might use it at Collins

- Quality Management System documents
- Technical Data Sheets
- Validation (Excel) workbooks
- Formulations
- MSDS creation/modification
- Marketing literature
- Record of Raw Materials
- ... and many more examples that may come from you!
